Insurance Risk & Claims Analysis

A comprehensive overview of policy distribution, claim patterns, and risk segmentation across **37,542 total policies** — covering demographics, vehicle data, coverage zones, and claim financials.

RISK ANALYTICS | CLAIMS DASHBOARD | PORTFOLIO OVERVIEW

Portfolio at a Glance

Key performance indicators across the entire insurance portfolio, reflecting total exposure, claim frequency, and average severity.

37,542

Total Policies

Active policies across all segments and coverage zones

$187.8M

Total Claim Amount

Aggregate claims paid out across the portfolio

0.5

Claim Frequency

Average number of claims per policy

$5.0K

Avg Claim Amount

Mean claim value per incident across all policyholders

These headline metrics form the foundation of the risk analysis. A claim frequency of 0.5 and average claim of $5K indicate a moderately active claims environment with manageable severity.

Policyholder Gender Distribution

The portfolio is nearly evenly split between male and female policyholders, reflecting a well-balanced demographic base with minimal gender skew in policy uptake.

Male Policyholders

18.7K

Male Policies

49.8% of total portfolio

Male policyholders represent a near-equal share of the portfolio, with slightly fewer policies than female counterparts.

Female Policyholders

18.8K

Female Policies

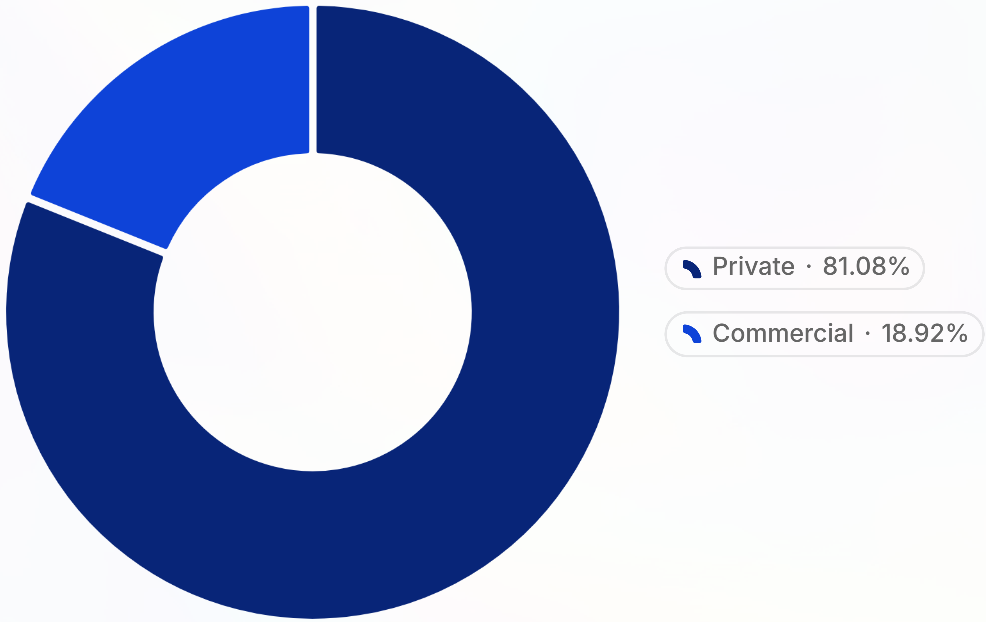
50.2% of total portfolio

Female policyholders hold a marginally higher share, indicating balanced market penetration across genders.

Policy Distribution by Car Use & Coverage Zone

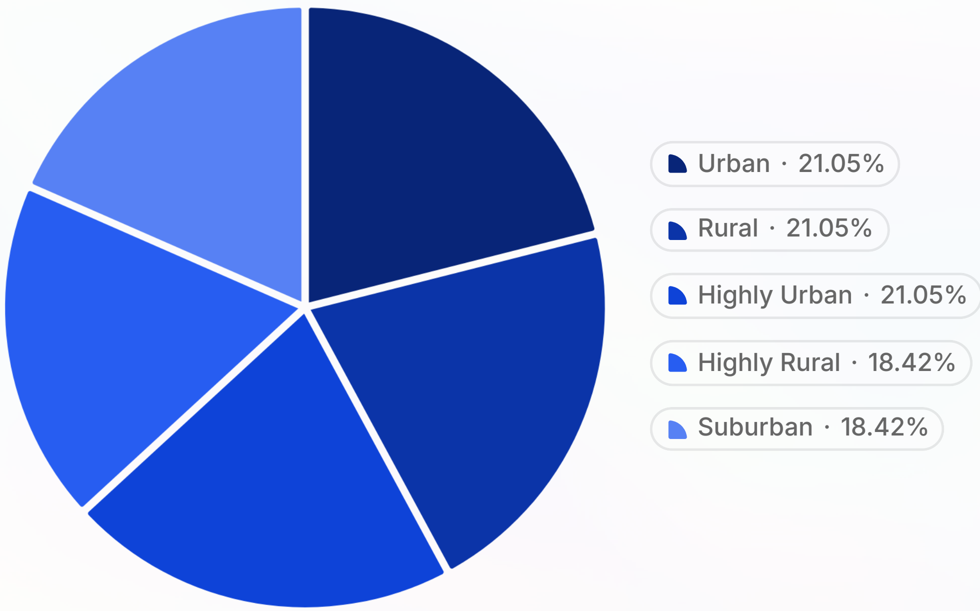
Understanding how vehicles are used and where policyholders are located is critical to assessing risk exposure. Private use dominates the portfolio, while coverage zones are remarkably evenly distributed.

Policies by Car Use



Private vehicles account for **30K (81%)** of all policies, with commercial use representing **7K (19%)**.

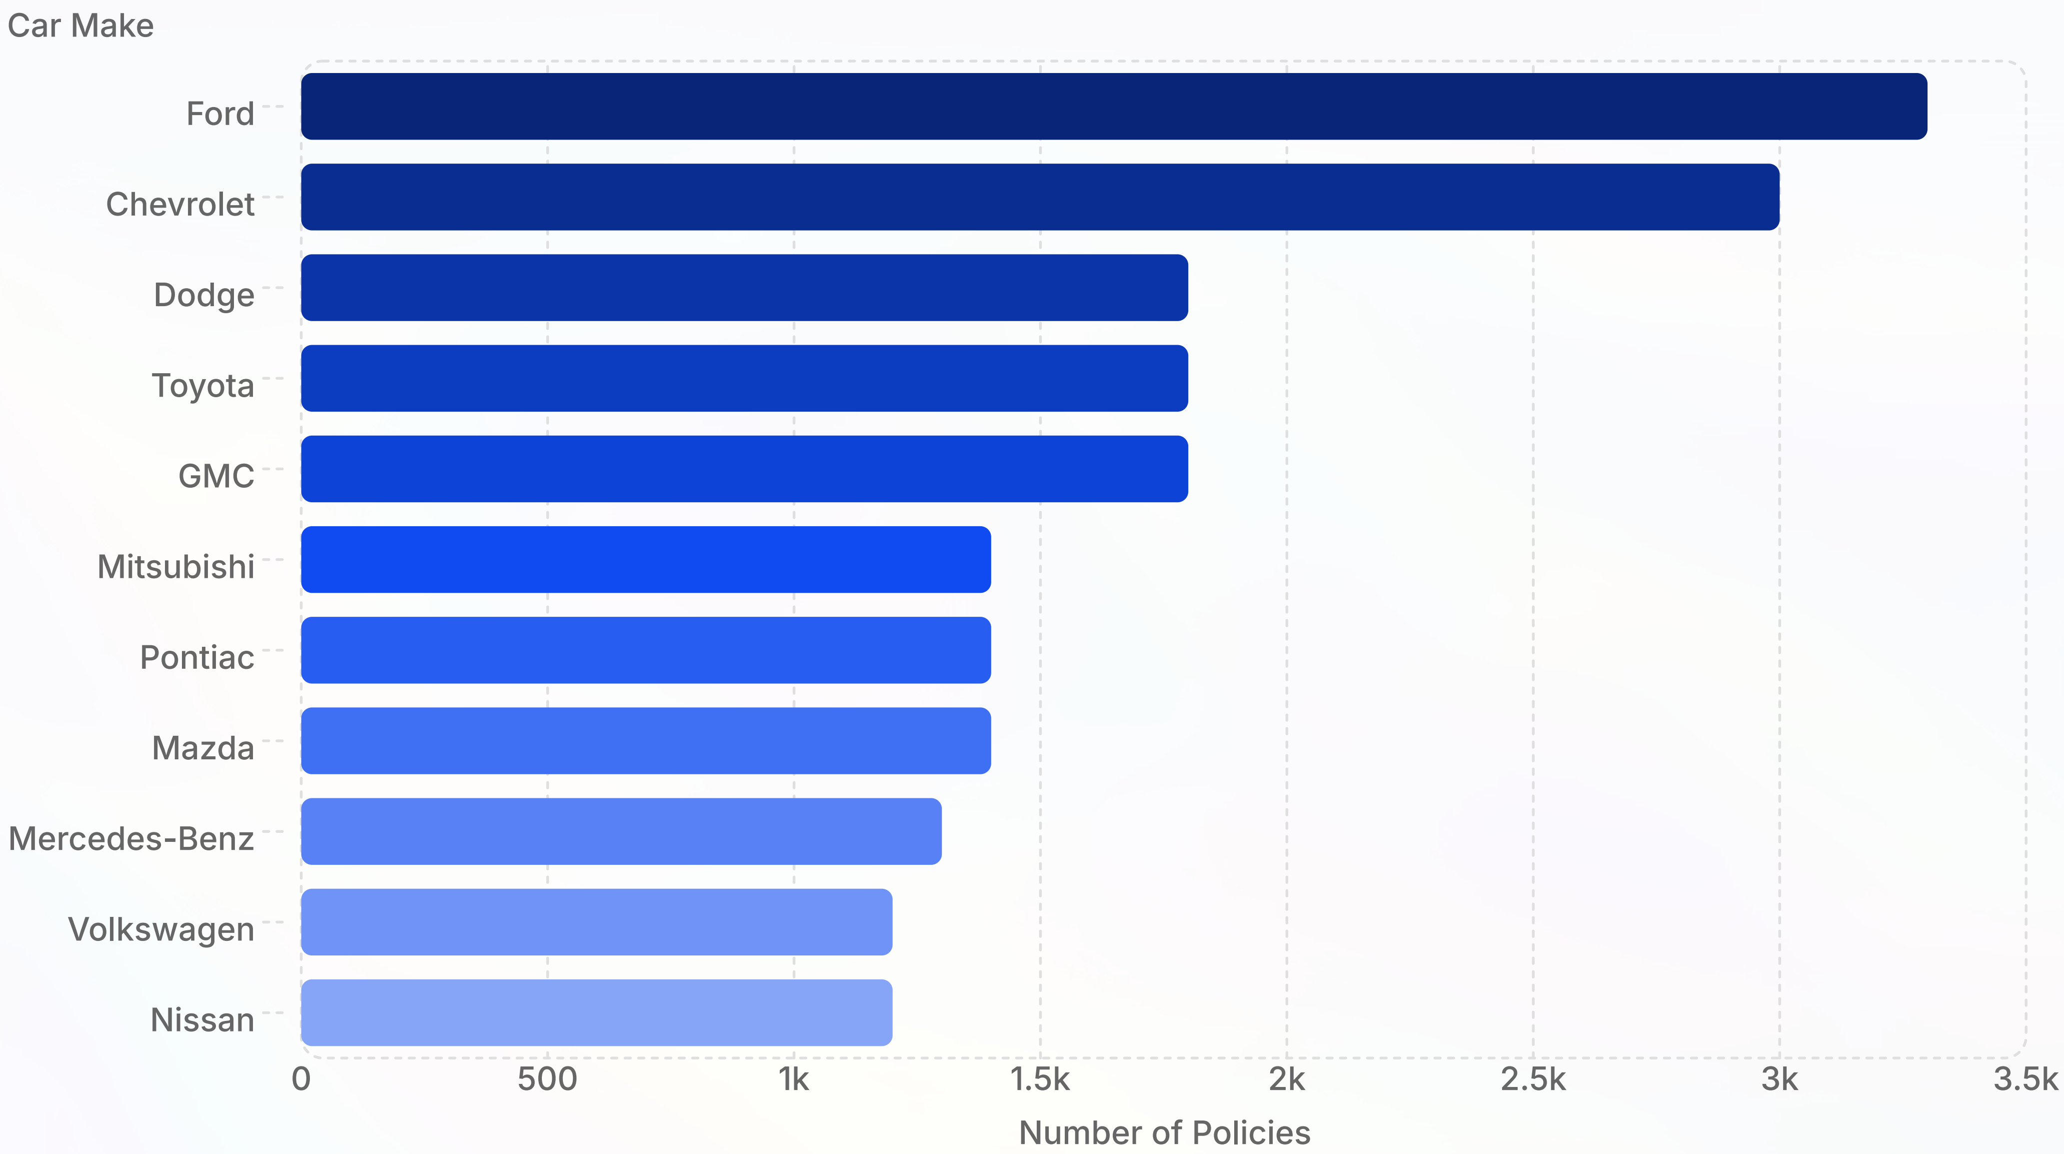
Policies by Coverage Zone



Coverage zones are nearly uniform — each zone holds between **7K–8K policies**, suggesting broad geographic diversification.

Top Vehicle Makes in the Portfolio

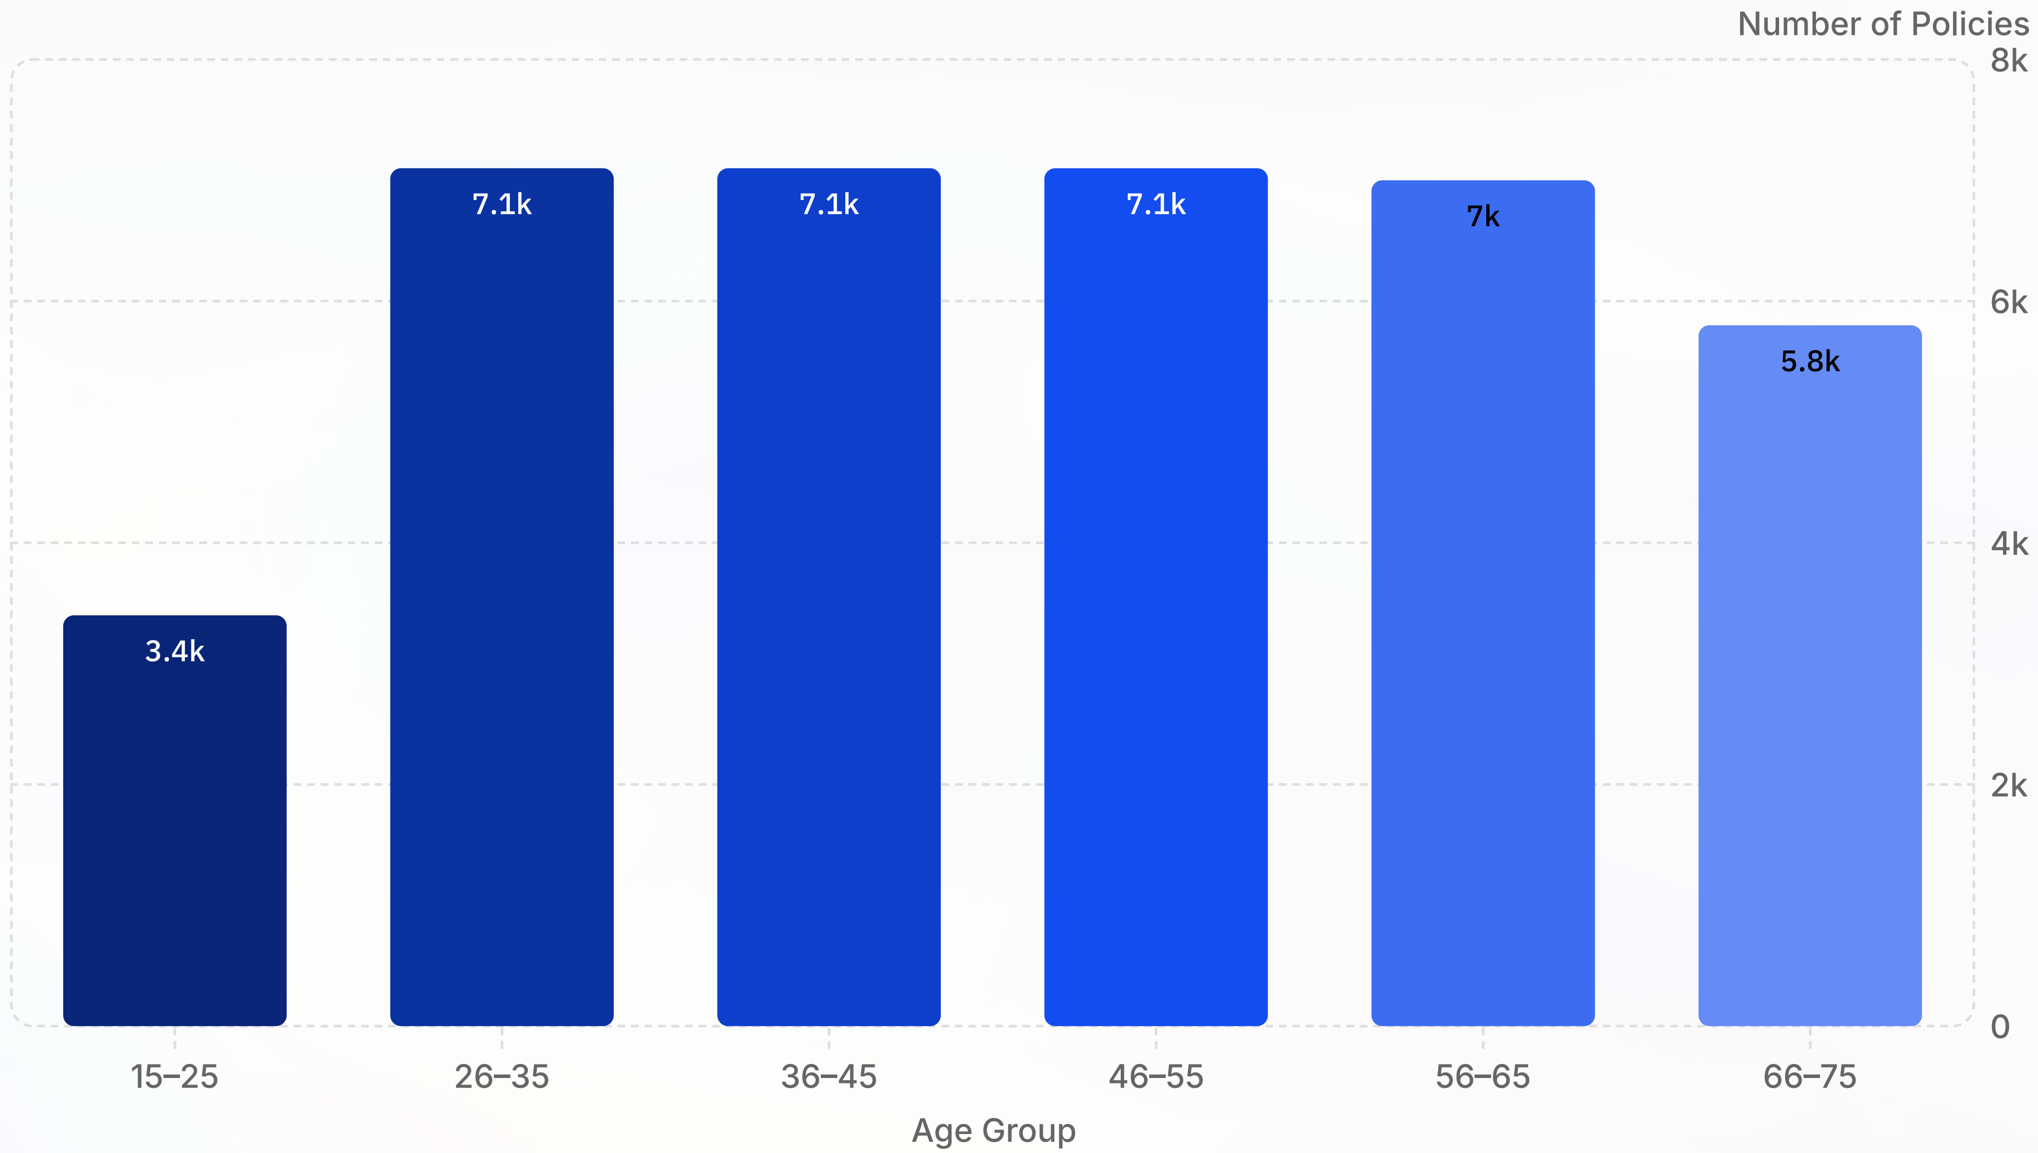
Ford and Chevrolet lead the portfolio by a significant margin, together accounting for over 6,300 policies. The remaining makes are more evenly distributed, with Japanese and European brands rounding out the top tier.



American brands (Ford, Chevrolet, Dodge, GMC) collectively dominate the portfolio, reflecting the domestic vehicle market composition of the insured population.

Policyholder Age Group Distribution

Age is one of the most significant risk factors in auto insurance. The portfolio shows a strong concentration in the 26–65 age range, with younger drivers (15–25) underrepresented — likely due to higher premiums or parental policy inclusion.



Young Drivers (15–25)

Only 3.4K policies — the smallest cohort, often considered highest risk

Core Working Age (26–55)

21.3K policies — the dominant segment, representing stable, experienced drivers

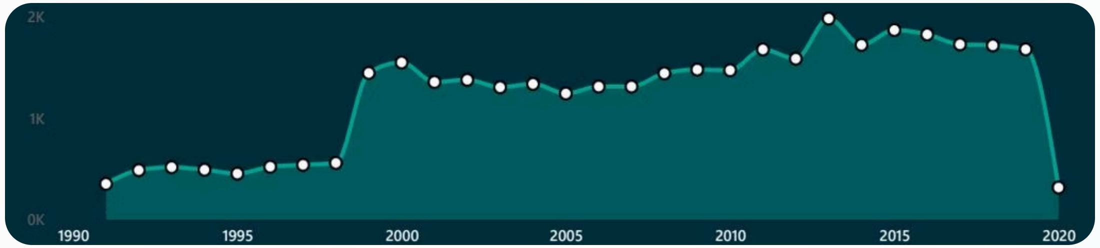
Senior Drivers (56–75)

12.8K policies — a significant and growing segment with distinct risk profiles

Kids Driving & Vehicle Year Trends

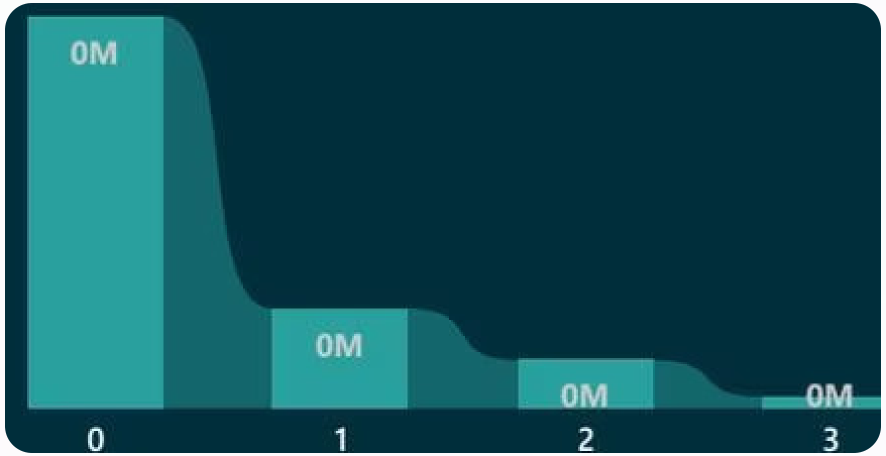
Two additional dimensions — the number of young drivers per household and the model year of insured vehicles — provide deeper insight into household risk profiles and fleet age distribution.

Policies by Car Year (1990–2020)



Policy counts surged around **1998–2000**, plateaued through the 2000s, peaked near **2015**, and declined sharply toward 2020 — reflecting vehicle age and replacement cycles.

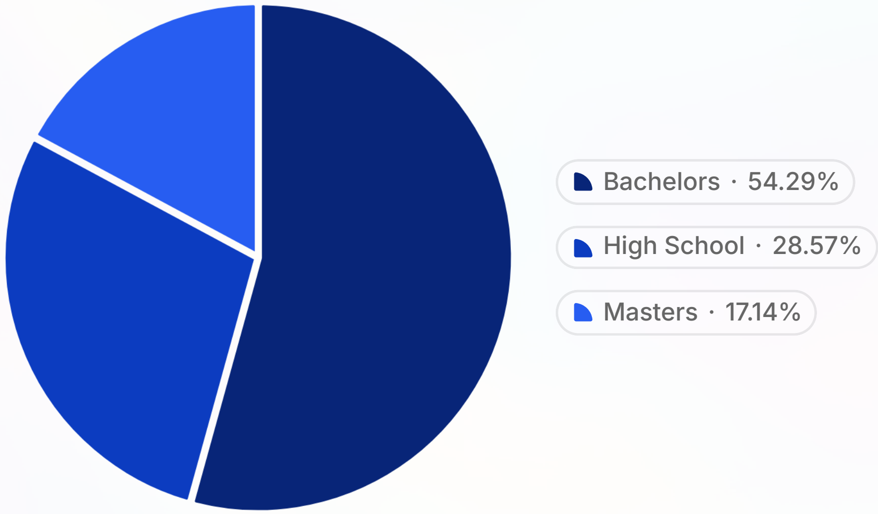
Policies by Kids Driving



The vast majority of policies have **0 kids driving**, with a steep drop-off at 1, 2, and 3 young drivers — indicating most households do not have additional young drivers on the policy.

Education Level of Policyholders

Education level is a key demographic variable in insurance risk modeling. Nearly half of all policyholders hold a Bachelor's degree, while High School graduates represent the second-largest group.



Education Breakdown

Bachelor's Degree

19K policies — 49.81% of the portfolio. The dominant education segment, suggesting a well-educated policyholder base.

High School

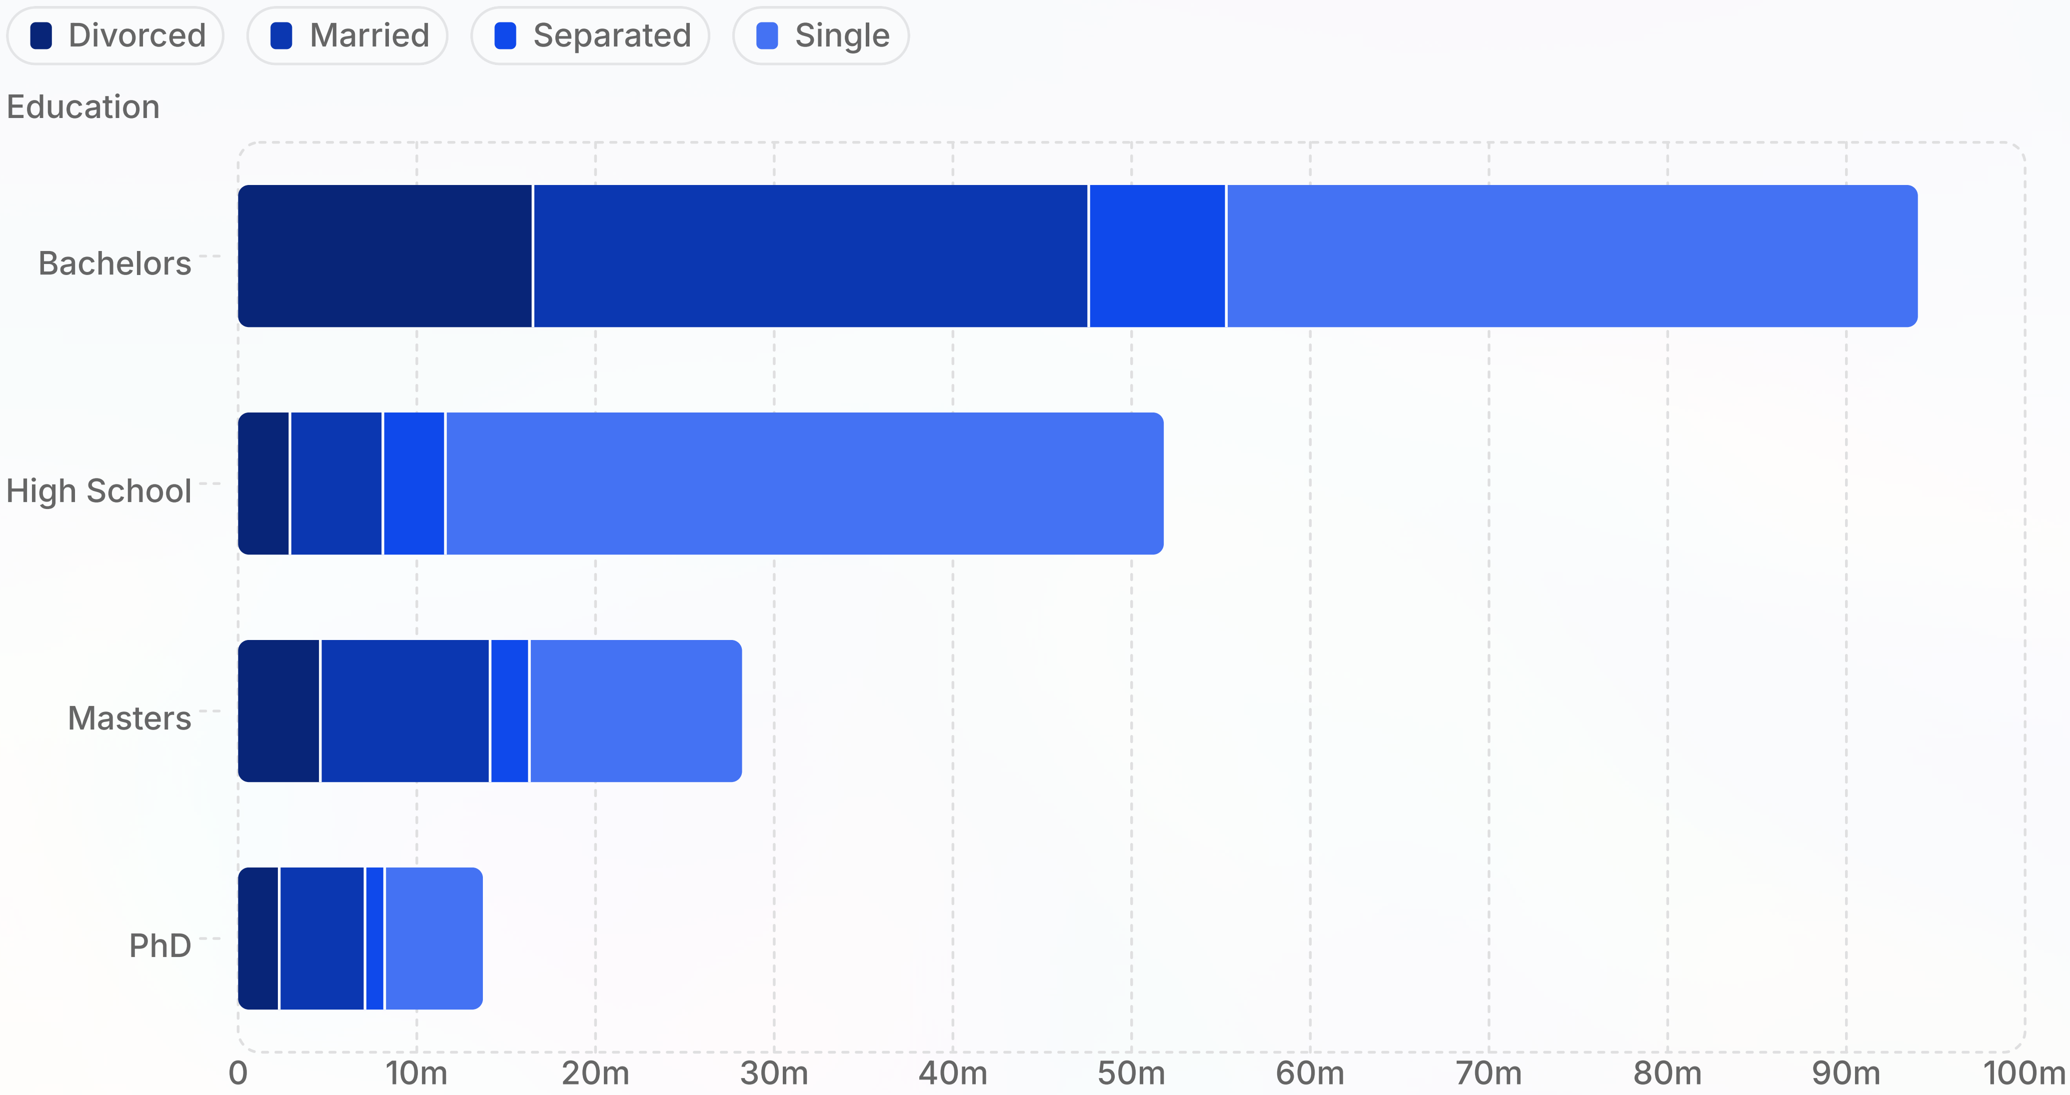
10K policies — 27.81%. The second-largest group, representing a significant portion of the risk pool.

Master's Degree

6K policies — 15.02%. Graduate-level policyholders with typically lower risk profiles.

Claim Amount by Education & Marital Status

Cross-referencing education level with marital status reveals significant variation in total claim amounts. Single policyholders across all education levels drive the highest claim totals — particularly among Bachelor's and High School graduates.



Education	Divorced	Married	Separated	Single
Bachelors	$16.5M	$31.1M	$7.7M	$38.7M
High School	$2.9M	$5.2M	$3.5M	$40.2M
Masters	$4.6M	$9.5M	$2.2M	$11.9M
PhD	$2.3M	$4.8M	$1.1M	$5.5M
Total	**$26.4M**	**$50.6M**	**$14.5M**	**$96.3M**

⚠ Single policyholders account for **$96.3M** in total claims — more than the Married ($50.6M), Divorced ($26.4M), and Separated ($14.5M) segments combined. This is a critical risk concentration to monitor.

Key Insights & Risk Summary

This analysis surfaces several actionable insights for underwriting strategy, pricing refinement, and claims management across the portfolio.

Single Policyholders Drive Disproportionate Claims

With **$96.3M** in total claims, single policyholders represent the highest-risk marital segment — nearly double that of married policyholders. Pricing models should reflect this elevated exposure.

Private Vehicle Use Dominates Risk Pool

At **81% of all policies**, private vehicle use is the primary exposure category. Commercial policies (19%) warrant separate risk treatment given different usage patterns and mileage profiles.

Geographic Risk is Well-Diversified

Coverage zones are nearly uniformly distributed (7K–8K each), reducing geographic concentration risk. No single zone dominates the portfolio, supporting stable aggregate loss ratios.

Young Drivers Remain Underrepresented

The 15–25 age group holds only **3.4K policies** — less than half of any other cohort. Growth opportunities exist in this segment, balanced against higher inherent risk.

Education Correlates with Claim Behavior

Bachelor's and High School graduates generate the largest claim volumes. Higher education levels (Masters, PhD) correlate with lower total claims, suggesting education as a viable risk segmentation variable.

Total Portfolio

37,542 policies · $187.8M claims

Claim Frequency
